

Abstract

Paper written by Researcher Javad Kamyabi former employee of Iran offshore Oil Co. presented to the International conference on:

ENERGY & SECURITY

IN THE

CHANGING WORLD

Hazardous Dumping Of Oil And Gas Energy Prices

Hazardous Dumping Of Oil And Gas Energy Prices

Some western energy advisors believe that the oil and gas prices must be held down to help the growth of global Industries. Such advisors also estimate that within 20 years from now, the world energy requirements shall be twice as much as the present requirements. This conception has given rise to aggressive policy by the multinational companies and superpowers to:

- 1- Rush new exploratory and development drillings for new oil and gas resources.
- 2- Utilize destructive military forces to occupy and control countries with oil and gas reserves.
- 3- Pretend that the world security is in danger.

Manmade Catastrophe to The Earth, Atmosphere and Universe

Manmade Catastrophe to The Earth , Atmosphere and Universe

Some Theories indicate that the energy released from the earth into the atmosphere must equal to or less than the energy radiated from the sun.

Other geophysical theories indicate that the Earth's Center of Mass and Central Force balance is directly and indirectly related to the balance of energies existed in the Earth's Crust. Therefor leading excessive drilling on the crust , and rapid draining of the Earth's internal oil and gas energy ,causes cracks in the crust of the Earth.

Such activities in limited area as Middle East along with the underground explosions, Firing missiles and rockets, Other daily explosions which have become usual practice in the Middle East region, all result in increasing the occurrence of global earthquakes. The excessive heat generated in the Middle East due to current conflicts, oil and gas processing activities and heavy air and steam ships traffics lead to migration of storms and cyclones to Western Hemisphere.

American meteorologist Edward Lorenz concluded in 1963 that the flap of a butterfly's wings in Singapore could affect a hurricane in North Carolina.

World Energy Requirements Solution

Considering Environmentalists concerns on increasing greenhouse effects and pollutions and based on the law of " Quantitative gradual changes result in qualitative abrupt change " If the present trend of air pollution continues the quality of the air shall be changed and the " Global Village" shall be sunk in the smokes and smog long before the end of the next two decades approaches.

Hence it is now required to limit fossil energy production and leave the pricing to the market.

Should the prevailing low prices of oil and gas continue, it would not be economically justified to search for and invest in alternative clean energies.

The alternative clean energies have been listed in the text of the paper.

The OPEC production quotas must be revised and proportioned to each member country's population and area and other NON OPEC countries follow suit. Furthermore European crude importers shall prefer importing refined products to avoid polluting their respective climates. Hence it is appropriate for a country like Iran to expand its refining capacity rather than expanding its producing areas.
