

Presentation title: Indonesia's Biofuel Development: Progress and Challenges

Abstract

Increasing global concerns over energy security, fuel prices volatility and greenhouse gas emissions have driven many countries to develop their renewable energy. Indonesia has made a firm commitment to the development of biofuel potential in the country, focusing on developing liquid biofuel derived from jatropha, palm oil, and sugar cane. This presentation provides an overview of biofuel development in Indonesia. There is also discussion on current progress and challenges faced by Indonesia's biofuels development as well as some recommendations relevant to policy makers and investors.
